

Post Doctoral Opportunities

The Department of Biogeochemistry at the Max Planck Institute for Marine Microbiology in Bremen, Germany is looking for postdocs who are skilled at FISH (collecting samples, designing probes, optimizing and performing hybridization, analyzing microscopy...).

The position would be working on marine systems (e.g. diatom-associated bacteria, ammonia oxidizing archaea, seagrass-hosted bacteria...). FISH visualization would likely be linked to biogeochemical rate data, nanoSIMS, and multi-omics analyses.

Feel free to share widely, I feel like the CBE might have some great candidates. If you know anyone who might be interested, they could email me at (andrewmaritan@montana.edu).
